

Tautomerism of 1,3,4-thiadiazole. Part II

L. Strzemecka

*Zakład Chemii Organicznej, Wydział Farmacji, Akademia Medyczna,
ul. Staszica 6, 20-081 Lublin, Poland*

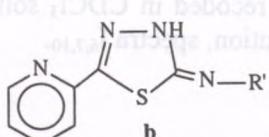

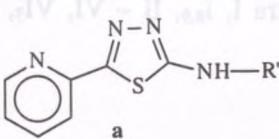

On the basis of the ^1H NMR spectra of 5-(2'-pyridyl)-2-allylamino-1,3,4-thiadiazole the presence of the tautomeric modifications **1a** **1b** **1c** has been stated. The chemical shifts values of the protons of allyl substituent indicate the sp^3 , sp^2 hybridization of exocyclic nitrogen atom 2N(5N) and the presence of the tautomeric modifications **1a** **1b** **1c** in both kinds of hybridization. The coupling constants of the protons of allyl substituent support the presence of the structures **1a_d**, **1b_d**, **1c_d**, **1a_e**, **1b_e**, **1c_e**, **1a_d**, **1b_d**, **1c_d**, **1a_e**, **1b_e**, **1c_e** as well as the transformation of the structures **1a_e**, **1b_e**, **1c_e** \leftrightarrow **1a_d**, **1b_d**, **1c_d**, **1a_e**, **1b_e**, **1c_e** \leftrightarrow **1a_d**, **1b_d**, **1c_d**. The long-range range coupling constants confirm the existence of the rigid structures **1a_{e'}**, **1b_{e'}**, **1c_{e'}** and sp^2 hybridization of exocyclic nitrogen atom 2N(5N).

1. INTRODUCTION

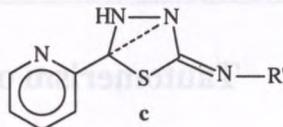

In the previous paper [1] it has been reported that in the ^1H NMR spectra of 5-(2'-pyridyl)-2-allyl-(cinnamyl-) amino-1,3,4-thiadiazole **1a**, **2a** (Scheme 1) the signals of NH group there are present in the range δ 13.64 - (-0.033).

It suggests the existence of the tautomeric modifications 3H-5(2'-pyridyl)-2-allyl-(cinnamyl-) imino-1,3,4-thiadiazole **1b**, **2b** and 3H-2(2'-pyridyl)-5-allyl-(cinnamyl-) imino-1,3,4-thiadiazole **1c**, **2c** as well as various mesomeric forms of these tautomeric structures **1abc**, **2abc**.

Scheme 1

Scheme 1 cont.

It has been earlier stated [1] that the signal of NH group in the range δ 13.64 – 3.562 point to the lack of the interactions of 2p orbitals of the nitrogen atoms 3N 4N of 1,3,4 – thiadiazole ring in the mesomeric modifications of the tautomeric forms **1abc**, **2abc**.

The exocyclic nitrogen atom 2N(5N) of 1,3,4 – thiadiazole ring of **1abc**, **2abc** tautomers may show sp^3 sp^2 and sp^2 sp hybridization, respectively. Consequently **1abc**, **2abc** tautomers may appear in both kinds of hybridization, the structures **1a_{de}** **1b_{de}** **1c_{de}**, **2a_{fg}** **2b_{fg}** **2c_{fg}**, respectively and **1a_e** **1b_e** **1c_e**, **2a_{fg}** **2b_{fg}** **2c_{fg}** tautomers may exist as the mesoionic forms **1h** **1i** **1j**, **2h** **2i** **2j**, respectively [1].

The synthesis and some properties of mesoionic 1,3,4-thiadiazoles have been summarized by C.G. Newton and C.A. Ramsden [2,3].

The aim of the present paper has been to prove the presence of the tautomeric forms **1abc** (Scheme 1) in both kinds of hybridization sp^3 , sp^2 on the basis of the 1H NMR spectra of product **1abc**.

The 1H NMR spectra of product **1abc** obtained by the cyclization of N^1 - (allylthiocarbamyl)- N^3 -phenyl-2-picolineamidrazone with ethanolic solution of HCl, diluted or concentrated hydrochloric acid at room or boiling temperature, methods I-IV [1]:

- I. diluted 3.6% ethanolic solution of HCl at room temperature
- II. diluted 3.6% hydrochloric acid at room temperature
- III. concentrated 36% hydrochloric acid at room temperature
- IV. boiling concentrated 36% hydrochloric acid

or by condensation of N^3 -phenyl-2-picolineamidrazone dihydrochloride and allylisothiocyanate in different solvents [1] methods V, VI:

- V. boiling anhydrous ethanol
- VI. boiling N,N-dimethylformamide

have been recorded in $CDCl_3$ solution, spectra I, $I_{8,9}$, II – VI, VI_3 , VI_4 and in DMSO solution, spectra $I_{6,7,10}$.

The ^1H NMR spectra I₆₋₉ have been taken applying various concentration of product **1abc** obtained by method I in DMSO or CDCl₃ solutions:

- in a DMSO solution, the concentration of product **1abc** amounts to (1:3) spectra I₆, I₇, respectively
- in CDCl₃ solution, the concentration of product **1abc** amounts to: 10 mg/0.5 ccm spectrum I₈, 25mg/ 0.5 ccm (maximal concentration) spectrum I₉

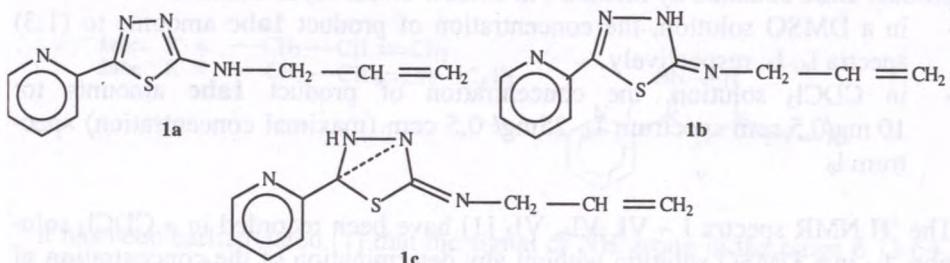

The ^1H NMR spectra I – VI, VI₃, VI₄ [1] have been recorded in a CDCl₃ solution, I₁₀ in a DMSO solution without any determination of the concentration of **1abc** product.

2. RESULTS AND DISCUSSION

In the ^1H NMR spectra I₆, I₇ of products **1abc** in a DMSO solution, the signal of NH group appear at δ 8.270 (1.08H broaded triplet), δ 8.310 (1.05H degenerated, broaded triplet) respectively (Table 1). The broaded triplet suggests that these protons take part in the intermolecular hydrogen bonds. The presence of the broaded triplet in the ^1H NMR spectrum I₆ indicates the slow exchange of the proton of NH group, due to this fact, the coupling of the protons of -NH-CH₂- group may be observed and support the existence of **1a** tautomer. The degenerated broaded triplet at δ 8.310 in the ^1H NMR spectrum I₇ support the existence of **1a** **1b** **1c** tautomers. These signals are the averaged ones in consequence of the rapid transitions of hydrogen atom between the exocyclic nitrogen atom 2N(5N) and 3N 4N ones of 1,3,4 – thiadiazole ring. These signals disappear in D₂O (spectrum I₁₀).

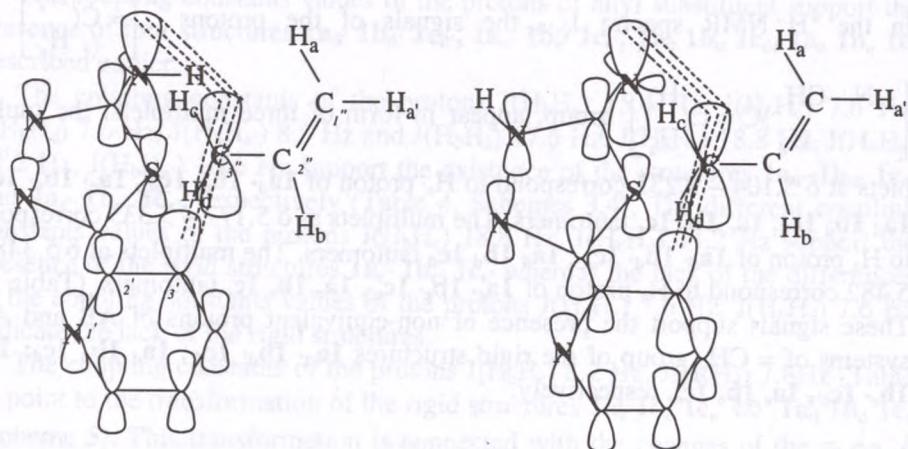

The chemical shifts and the coupling constants values of the protons of allyl substituent as well as the long-range coupling constants support the different hybridization sp³, sp² of exocyclic nitrogen atom 2N(5N) of **1a** **1b** **1c** tautomers.

The long-range coupling constants of the protons in the range 37.280 Hz – 43.776 Hz spectra I – VI, VI₃, VI₄ [1] (Table 2), support the presence of the coupling of the protons of the pyridyl and -N-CH₂- CH=CH₂ groups via 2p orbitals of 3'C 3''C of the rigid structures **1a_e**... **1b_e**... **1c_e**... (Scheme 2) and indicate sp² hybridization of exocyclic nitrogen atom 2N(5N).

Scheme 2

Behavior of **1a_e'''** and **1b_e'''** in the range of temperatures from 3°C and the minimal changes of spin application of **2b** (5%)

In the range of temperatures from 3°C to 5% spin application of **2b** there occurs a noticeable change in the coupling constants of the protons of the exocyclic methyl group of **1b_e**, **1b_d** and **1c_e** and the difference between the coupling constants of the protons of the exocyclic methyl group of **1a_e** and **1a_d** is increased. The coupling constants of the protons of the exocyclic methyl group of **1b_e** (δ 5.997 – 6.033, δ 5.924 – 5.960 ppm) correspond to the second pair of triplets in the ¹H NMR spectra of **1b_e**, **1b_d** and **1c_e**. The difference between the coupling constants of the protons of the exocyclic methyl group of **1a_e** (δ 5.924 – 5.960 ppm) and **1a_d** (δ 5.997 – 6.033 ppm) corresponds to the first pair of triplets in the ¹H NMR spectra of **1a_e**, **1a_d**, **1b_e**, **1b_d** and **1c_e**. The differences between the coupling constants of the protons of the exocyclic methyl group of **1b_e** (δ 5.997 – 6.033, δ 5.924 – 5.960 ppm) and **1c_e** (δ 5.924 – 5.960, δ 5.824 – 5.860 ppm) correspond to the third and fourth pairs of triplets in the ¹H NMR spectra of **1b_e**, **1b_d** and **1c_e**.

**1c_e'''**

In the ¹H NMR spectra **I₆ – 10** there occur two pairs of triplets of = CH_b- group (Table 4) and indicate the existence of **1a** **1b** **1c** tautomers in both kinds of hybridization. The triplets at δ 5.997 – 6.033, δ 5.924 – 5.960 correspond to H_b proton of **Z** and **E** isomers, respectively of **1a_a**, **1b_a**, **1c_a**, **1a_d** **1b_d** **1c_d** tautomers in which the exocyclic nitrogen atom 2N(5N) shows sp^3 hybridization, the second pair of triplets at δ 6.097 – 6.133, δ 5.824 – 5.860 correspond to H_b proton of **Z** and **E** isomers, respectively of **1a_e**, **1b_e**, **1c_e**, **1a_e** **1b_e** **1c_e** tautomers with sp^2 hybridization of 2N(5N) (Schemes 3,4,5).

In the ^1H NMR spectra I₆₋₁₀ the signals of the protons $\left[=\text{C}\begin{array}{c} \text{H}_a \\ \text{H}_{a'} \end{array} \right]$ of $\left[-\text{N}-\text{CH}_2 \right] \text{C}=\text{C}\begin{array}{c} \text{H}_a \\ \text{H}_{a'} \end{array}$ group, appear in form of three multiplets: the multiplets at δ 5.104 – 5.235 correspond to H_{a'} proton of **1a_d**, **1b_d**, **1c_d**, **1a_e**, **1b_e**, **1c_e**, **1a_d**, **1b_d**, **1c_d**, **1a_e**, **1b_e**, **1c_e** tautomers. The multiplets at δ 5.177 – 5.333 correspond to H_a proton of **1a_d**, **1b_d**, **1c_d**, **1a_d**, **1b_d**, **1c_d** tautomers. The multiplets at δ 5.348 – 5.482 correspond to H_a proton of **1a_e**, **1b_e**, **1c_e**, **1a_e**, **1b_e**, **1c_e** tautomers, (Table 5). These signals support the presence of non-equivalent protons of AB and AX systems of =CH₂ group of the rigid structures **1a_d**, **1b_d**, **1c_d**, **1a_d**, **1b_d**, **1c_d**; **1a_e**, **1b_e**, **1c_e**, **1a_e**, **1b_e**, **1c_e**, respectively.

Table 2

δ 3.999	J(H _d H _{6'}) 37.696 Hz	(I)
δ 8.598	J(H _{6'} H _{a'}) 38.144 Hz	(VI)
δ (-0.033)	J(H _{NH} H _{6'}) 38.272 Hz J(H _{NH} H _{a'})	(III)
δ 7.754	J(H _{5'} H _{a'}) 38.336 Hz	(I)
δ 8.584	J(H _{6'} H _{a'}) 38.400 Hz	(IV)
δ 4.018	J(H _{NH} H _{a'}) 38.656 Hz J(H _{NH} H _{6'})	(VI ₄)
δ 7.852	J(H _{5'} H _{a'}) 38.912 Hz	(VI)
δ 5.886	J(H _b H _{3'}) 39.168 Hz	(III)
δ 7.974	J(H _{4'} H _{a'}) 39.296 Hz	(V)
δ 7.331	J(H _{3'} H _{a'}) 39.392 Hz	(IV)
δ 7.998	J(H _{4'} H _{a'}) 40.064 Hz	(V)
δ 5.477	J(H _{a'} H _{4'}) 40.192 Hz	(III)
δ 7.341	J(H _{3'} H _{a'}) 40.640 Hz	(IV)
δ 8.152	J(H _{4'} H _{a'}) 40.672 Hz	(I)
δ 5.214	J(H _{a'} H _{3'}) 43.712 Hz	(IV)
δ 8.223	J(H _{4'} H _{a'}) 43.776 Hz	(V)

In the ^1H NMR spectra I_{7,10} a signal of -N-CH₂- group arises as a multiplet at δ 3.988 – 4.086 (Table 3) and indicates the presence of the structures **1a_d**, **1b_d**, **1c_d**, **1a_e**, **1b_e**, **1c_e**, **1a_d**, **1b_d**, **1c_d**, **1a_e**, **1b_e**, **1c_e**, (Schemes 3,4,5).

The coupling constants values of the protons of allyl substituent support the presence of four structures **1a_d**, **1b_d**, **1c_d**, **1a_e**, **1b_e**, **1c_e**, **1a_d 1b_d 1c_d**, **1a_e 1b_e 1c_e** described earlier.

The coupling constants of the protons $J(H_bH_a)$ 15.4 Hz, $J(H_bH_c)$ 7.6 Hz, $J(H_bH_d)$ 7.6 Hz, $J(H_bH_{a'})$ 8.5 Hz and $J(H_bH_a)$ 17.6 Hz, $J(H_bH_c)$ 18.8 Hz, $J(H_bH_d)$ 11.2 Hz, $J(H_bH_{a'})$ 10.6 Hz support the existence of the structures **1a_d**, **1b_d**, **1c_d** and **1a_e**, **1b_e**, **1c_e**, respectively (Table 4, Schemes 3,4). The different coupling constants values of the protons $J(H_bH_c)$ 18.8 Hz, $J(H_bH_d)$ 11.2 Hz support the presence of the rigid structures **1a_e**, **1b_e**, **1c_e**, whereas the lack of the differences in the coupling constants values of the protons $J(H_bH_c)$ 7.6 Hz, $J(H_bH_d)$ 7.6 Hz indicate the lack of the rigid structures.

The coupling constants of the protons $J(H_bH_c)$ 8.2 Hz, $J(H_bH_d)$ 7.8 Hz (Table 4) point to the transformation of the rigid structures **1a_e 1b_e 1c_e** \leftrightarrow **1a_d 1b_d 1c_d** (Scheme 5). This transformation is connected with the changes of the $\pi \leftrightarrow \delta$ bonds of 2N (5N) 3"C and the mutual changes of sp^2 hybridization of 2N (5N) 3"C and sp^3 one.

In the 1H NMR spectrum I₆ a multiplet of -N-CH₂- group undergoes splitting to three multiplets at δ 3.922 – 3.954, δ 3.978 – 4.008, δ 4.032 – 4.061 which correspond to the protons of -N-CH₂- group of the structures **1a_d**, **1b_d**, **1c_d**, **1a_e**, **1b_e**, **1c_e** and suggest the differences in the interactions of sp^3 , p orbitals of 2N 3"C of the structures **1a_d**, **1b_d**, **1c_d**, **1a_e**, **1b_e**, **1c_e**, respectively. The coupling constants of the protons $J(H_bH_a)$ 15.4 Hz, $J(H_bH_c)$ 7.6 Hz, $J(H_bH_d)$ 7.6 Hz, $J(H_bH_{a'})$ 8.5 Hz and $J(H_bH_a)$ 17.6 Hz, $J(H_bH_c)$ 18.8 Hz, $J(H_bH_d)$ 11.2 Hz, $J(H_bH_{a'})$ 10.6 Hz analogously as those in the 1H NMR spectrum I₇ confirm the presence of the structures **1a_d**, **1b_d**, **1c_d**, **1a_e**, **1b_e**, **1c_e** respectively (Schemes 3,4).

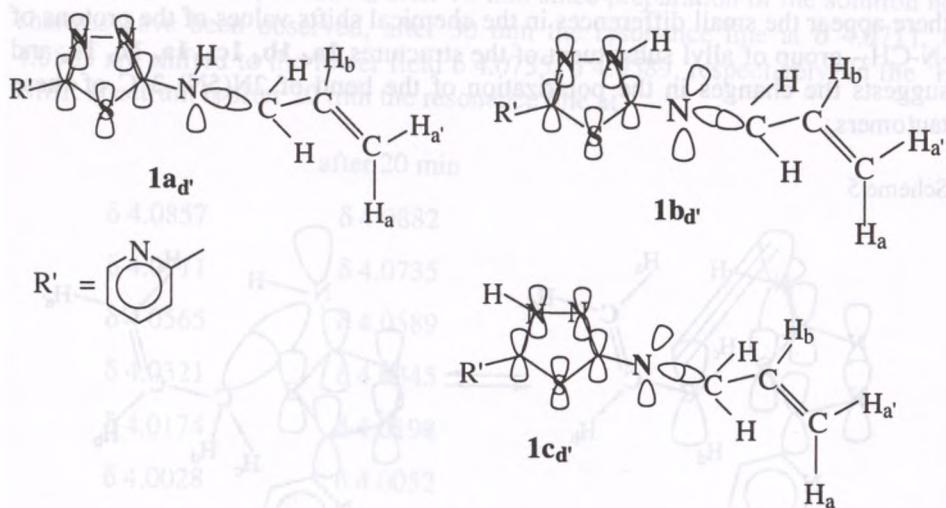

The coupling constants of the protons $J(H_bH_c)$ 8.2 Hz, $J(H_bH_d)$ 8.2 Hz point to the lack of the rigid structures and suggest the transformation of the structures **1a_e**, **1b_e**, **1c_e** \leftrightarrow **1a_d**, **1b_d**, **1c_d** as well as the changes of the $\pi \leftrightarrow \delta$ bonds and the mutual changes of sp^2 hybridization of 2N (5N) 3"C and sp^3 one.

In the 1H NMR spectra I_{8,9} (Table 3) independently on the concentration of the product used the signal of the protons of -N-CH₂- group arises at δ 4.003 – 4.086 as two triplets δ 4.003 – 4.032, δ 4.056 – 4.086 and supports the presence of non-equivalent protons AB system of -N-CH₂- group of a rigid structures **1a_d** **1b_d** **1c_d**, **1a_e** **1b_e** **1c_e**, (Scheme 5).

Scheme 3

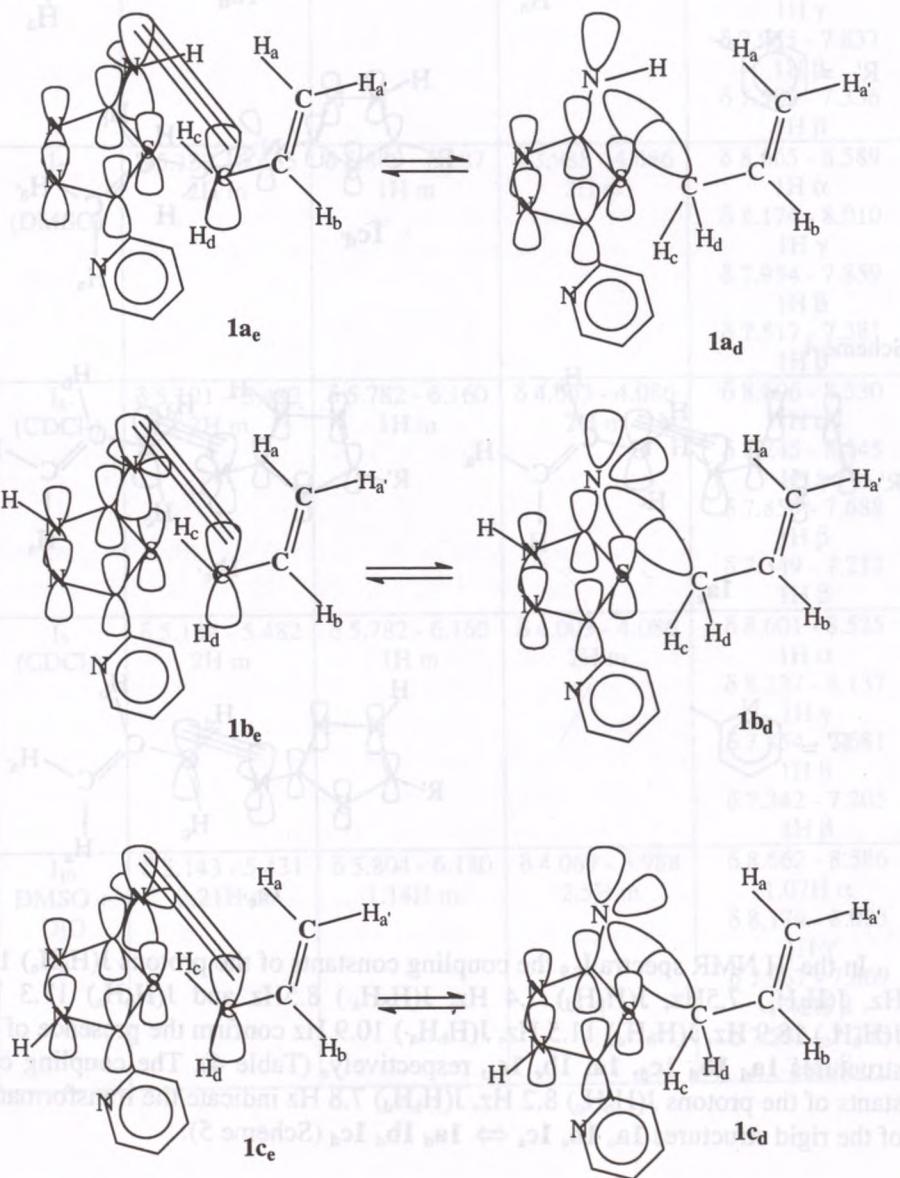

Scheme 4

In the ¹H NMR spectra I_{8,9} the coupling constants of the protons J(H_bH_a) 12.3 Hz, J(H_bH_c) 7.5 Hz, J(H_bH_d) 7.4 Hz, J(H_bH_{a'}) 8.5 Hz and J(H_bH_a) 17.3 Hz, J(H_bH_c) 18.9 Hz, J(H_bH_d) 11.5 Hz, J(H_bH_{a'}) 10.9 Hz confirm the presence of the structures **1a_d** **1b_d** **1c_d**, **1a_e** **1b_e** **1c_e**, respectively, (Table 4). The coupling constants of the protons J(H_bH_c) 8.2 Hz, J(H_bH_d) 7.8 Hz indicate the transformation of the rigid structures **1a_e** **1b_e** **1c_e** ⇌ **1a_d** **1b_d** **1c_d** (Scheme 5).

In the ^1H NMR spectra $\text{I}_{8,9}$ one can observe insignificant changes in time; there appear the small differences in the chemical shifts values of the protons of $-\text{N}-\text{CH}_2-$ group of allyl substituent of the structures 1a_d 1b_d 1c_d , 1a_e 1b_e 1c_e and suggests the changes in the polarization of the bond of $2\text{N}(5\text{N})\ 3''\text{C}$ of these tautomers.

Scheme 5

In the ^1H NMR spectrum I₈ after 10 min since preparation of the solution no changes have been observed, after 30 min the resonance line at δ 4.0711, δ 4.0565 are shifted to the lower field δ 4.0735, δ 4.0589, respectively. In the ^1H NMR spectrum I₉ after 20 min the resonance line at

after 20 min

δ 4.0857	δ 4.0882			
δ 4.0711	δ 4.0735			
δ 4.0565	δ 4.0589			
δ 4.0321	δ 4.0345			
δ 4.0174	δ 4.0198

Scheme 6

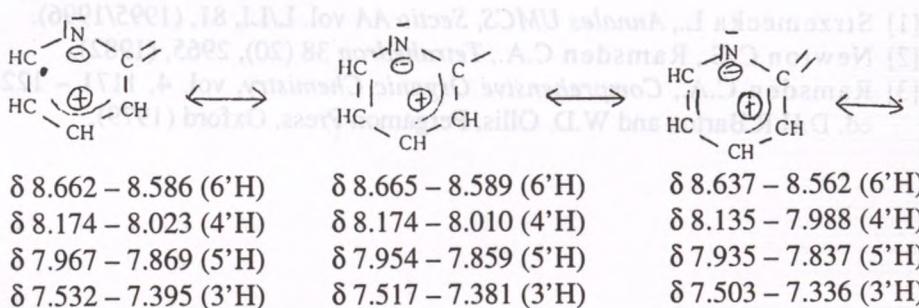

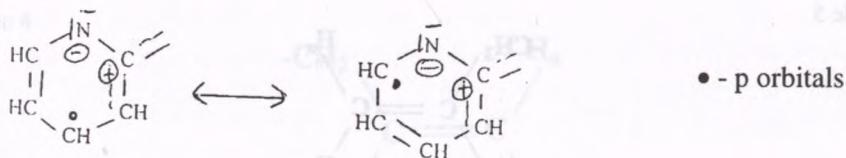

Table 6

δ 8.606 – 8.530 (6'H)	δ 8.601 – 8.525 (6'H)
δ 8.245 – 8.145 (4'H)	δ 8.237 – 8.137 (4'H)
δ 7.859 – 7.688 (5'H)	δ 7.854 – 7.681 (5'H)
δ 7.349 – 7.212 (3'H)	δ 7.342 – 7.205 (3'H)

The differences in the polarization of the bond of 2N(5N) 3"C may be connected with the differences in the interactions of orbitals of these atoms and may be caused by the differences in the spins states of electrons as well as in the phases of their orbitals. In the structures **1a_e**, **1b_e**, **1c_e**, **1a_e** **1b_e** **1c_e** the polarization of this bond may be influenced by 2p orbitals both of 2C(5C) of 1,3,4-thiadiazole ring and of 2"C 1"C of allyl substituent. Consequently, the chemical shifts values of the protons of -N-CH₂- group of allyl substituent depend on the electron configuration of exocyclic nitrogen atom 2N(5N).

In the ¹H NMR spectra I₆₋₁₀ the signals of the protons of the pyridyl substituent (Table 3) indicate the existence of the following mesomeric structures of the pyridine ring (Scheme 6).

3. EXPERIMENTAL

The ¹H NMR spectra I₆₋₁₀ of product **1abc** were measured with a Tesla BS 677 A spectrometer (100 MHz with T. F.) in CDCl₃ or DMSO solutions at room temperature with TMS as the internal standard. Chemical shifts are given in δ scale. Compounds **1abc** were obtained by method I [1].

CURRICULUM VITAE

Dr Leokadia Strzemecka. Born in Poland in 1951. Graduated from Faculty of Pharmacy of Medical Academy in Lublin and received her Ph. D. degree also at Faculty of Pharmacy. She is employed with the synthesis of heterocyclic compounds as well as the studies on the tautomerism of the heterocyclic systems.

Instytut Chemiczny Akademii Medycznej w Lublinie, 16-031 Lublin, Poland

Synthesis of 2'-pyridyl-2-cinnamylamino-1,3,4-thiadiazoles and the tautomeric modifications 2a/2b/2c. The protonation of cinnamyl substituted thiadiazoles at the cyclic nitrogen atom 2N(SM) and the presence of the cations 2a/2b/2c in both kinds of hybridization and the protonation of cinnamyl substituted thiadiazoles at the ring nitrogen atom 1N(SM).
